

Erratum

In the March 2018 issue of *Alzheimer's & Dementia*, the article “2018 Alzheimer's Disease Facts and Figures” incorrectly reported the estimated total lifetime cost of care (including Medicare, Medicaid, out-of-pocket expenditures, and the value of informal care) per person with dementia. The correct cost is estimated at \$341,840 in 2017 dollars (\$321,780 in 2015 dollars). The costs associated with family care are \$143,735 in the value of informal care and \$95,441 in out-of-pocket-expenses related to care in 2017 dollars. Compared with an individual without dementia, the incremental lifetime cost of dementia was \$196,002 in 2017 dollars. Also, the population in whom the estimated cost savings of slowing functional decline was discussed was not specified. The population was people with dementia. In addition, in the Special Report, the cumulative lifetime savings in medical and long-term care costs under the full early diagnosis scenario was not directly stated. It is \$7.9 trillion.
